## **Stokes First Problem Solution**

In fluid dynamics, Rayleigh problem also known as Stokes first problem is a problem of determining the flow created by a sudden movement of an infinitely long plate from rest, named after Lord Rayleigh and Sir George Stokes. This is considered as one of the simplest unsteady problem that have exact solution for the Navier-Stokes equations.

In fluid dynamics, Stokes problem also known as Stokes second problem or sometimes referred to as Stokes boundary layer or Oscillating boundary layer is a problem of determining the flow created by an oscillating solid surface, named after Sir George Stokes. This is considered as one of the simplest unsteady problem that have exact solution for the Navier-Stokes equations.

“Stokes’s first problem” involves the instantaneous acceleration at time  $t = 0$  of a flat plate to a constant velocity  $U_0$  while in contact with a “semi-infinite,” static fluid as shown in Fig. P6.70. For a constant fluid density and viscosity, the simplified Navier–Stokes equation is

Stokes Second Problem ATP. Stokes apparently had many problems. This Second Problem is identical to the First Problem, except that we replace (2) with.  $u(y=0,t) = U \cos(\omega t)$  — the plate now oscillates. Note that we are interested only in the steady periodic solution:  $u$  behaves as  $\cos(\omega t + \Phi)$  in time, where the phase  $\Phi$  is independent of  $t$ .

63 Stokes classic solution  $w_+$  for the flow driven by the impulsive motion of an infinite plate is  $w_+ = 1 - \text{erf}(\frac{y}{\sqrt{2\nu t}})$   
Substituting these solutions for  $w_+$  and  $w_-$  in (4) one has  $w = \frac{1}{2} + \frac{1}{2} \text{erf}(\frac{y}{\sqrt{2\nu t}}) + k \int_{-\infty}^y \text{Imexp}(\frac{y-s}{\sqrt{2\nu t}}) dx', \frac{2(\sqrt{t})'}{2}$  where the absolute value  $|y|$  is used to assure that the solution is valid in the lower half-
